

Day 18 — Specialty Data Support Completion Report

Assignee: Taha Sajjad | Role: Domain Data Support

Task date: 18 September 2026 | Package generated: 28 September 2026

Submission metadata

Branch: feature/sprint1-specialty-data-taha

PR: Task-sept18-specialty-data-tahasajjad

Reviewer: Syeda Isma Nazir

Repository: usmankhalid172/MedNoviAI-AI

What was completed

A standardized symptom-keyword to specialty dictionary was prepared with 99 primary mappings and 11 emergency override patterns. The package also includes a JSON Schema, documentation payload examples, an SQA checklist, a deterministic validator, pytest checks, a PR description, and verification sources.

Quality controls

- ✓ UTF-8 JSON and parseability
- ✓ Canonical specialty names
- ✓ Normalized lowercase keywords
- ✓ Duplicate prevention after normalization
- ✓ Restricted routing targets
- ✓ Emergency-first routing policy
- ✓ Required example mappings included

Validation result

PASS: 99 specialty keywords, 11 emergency overrides. PASS: canonical specialties, normalized keys, and routing targets are valid.

Safety boundary

This dataset is a routing/reference layer and is not a diagnostic model. Emergency-sensitive patterns are separated from ordinary specialty routing. Actual endpoint integration must be verified in the repository environment by the central endpoint owner before merge.

Release gate

Run the validator and tests, run repository CI, confirm the actual endpoint contract/integration, and obtain Syeda Isma Nazir's approval before merging to main.
